Editorials

1273 Editorial: Modulation of HMGB1 holds promise for managing sepsis immune paralysis.
By A. Blumental-Perry and T. L. Bonfield
Discussion on targeting HMGB1 at the right point in sepsis to skew the host response toward efficient resolution, of both the inciting infection and inflammation.
► SEE CORRESPONDING ARTICLE ON PAGE 1281

1276 Editorial: IL-27 expression following TLR activation in bone: sounding the alarm for repair.
By M. L. Figueiredo
Discussion of how autocrine IL-27 in the bone immunological niche links TLR and bone homeostasis.
► SEE CORRESPONDING ARTICLE ON PAGE 1289

Frontline Science

SPOTLIGHT ON LEADING EDGE RESEARCH

1281 Frontline Science: HMGB1 induces neutrophil dysfunction in experimental sepsis and in patients who survive septic shock.
HMGB1 in the late phase of sepsis plays a specific role in the development of post-sepsis immunosuppression, and specifically neutrophil dependent antibacterial defense mechanisms.
► SEE CORRESPONDING EDITORIAL ON PAGE 1273

1289 Frontline Science: Human bone cells as a source of IL-27 under inflammatory conditions: role of TLRs and cytokines.
F. Lavoisserie, L. Bari, V. Dumaine, C. Dietrich, A. Audebourg, B. Raden-Bussière, P. Auvray, M.-C. Vacher-Lavenu, and O. Devogué
Osteoclasts and osteoblasts express IL-27 under specific stimulation in vitro; IL-27-producing bone cells are detected in situ in human bone tissues in various inflammatory settings.

REVIEW

1301 cAMP: a multifaceted modulator of immune synapse assembly and T cell activation.
V. B. Arumugham and C. T. Baldari
Review of how cAMP modulates TCR signaling, and how T cells generate local cAMP pools to spatially restrict signaling during immune synapse assembly.

Research

Receptors, Signal Transduction, & Genes

1317 IL-18-dependent NKG2D ligand upregulation on accessory cells is mediated by the PI3K/GSK-3 pathway.
J. D. Brandstadter, H. Chen, S. Jiang, X. Huang, and Y. Yang
IL18-dependent Rae-1 upregulation on accessory cells is mediated by the Mcl88bPI3K-GSK3 pathway, providing important insights into the design of effective NK cell-based immunotherapies.

Inflammation, Extracellular Mediators, & Effector Molecules

1325 Tpl2 promotes neutrophil trafficking, oxidative burst, and bacterial killing.
N. V. Acuff, X. Li, J. Elmore, B. Rada, and W. T. Watford
Tpl2 promotes neutrophil antimicrobial pathways, including cytokine secretion, oxidative burst, and bacterial killing, via cell-intrinsic mechanisms; Tpl2 also regulates neutrophil recruitment primarily via neutrophil-extrinsic mechanisms.

1355 Different dynamics of NLRP3 inflammasome-mediated IL-1β production in GM-CSF– and M-CSF–differentiated human macrophages.
M. M. Budai, J. Tózosér, and S. Benkö
Cell specific diversity of human NLRP3 biology on emphasis of macrophage subtypes.

1349 Macrophage-derived apoptotic bodies promote the proliferation of the recipient cells via shuttling microRNA-221/222.
LPS-induced, macrophage-derived ABs promote the proliferation of their recipient cells via AB-shuttling miRNAs.

1361 Chemical composition and phagocyte immunomodulatory activity of Ferula iliensis essential oils.
Activation of neutrophils by Ferula iliensis essential oils enriched in (E/Z)-propenyl sec-butyl disulfides is mediated by activation of transient receptor potential V1 channels.

Host Defense & Pathophysiology

1373 Rationalized design of a mucosal vaccine protects against Mycobacterium tuberculosis challenge in mice.
MPL-chitosan is a potential new protective mucosal TB vaccine adjuvant.

1383 Neutrophils regulate the lung inflammatory response via γδ T cell infiltration in an experimental mouse model of human metapneumovirus infection.
N. R. Cheemarla, M. D. R. Baltos-Lara, S. Naidu, and A. Guerrero-Plata
Neutrophils regulate HMPV-induced pathogenesis.

1393 Phenotypic and functional consequences of different isolation protocols on skin mononuclear phagocytes.
Comparison of skin mononuclear phagocyte isolation techniques on function and subset definition, and the effects of collagenase blends on pathogen binding receptor cleavage.

Translational & Clinical Immunology

1405 STAT5 phosphorylation in CD4 T cells from patients with SLE is related to changes in their subsets and follow-up disease severity.
Imbalanced STAT5 phosphorylation in conventional and regulatory CD4 T cell subsets from SLE patients is related to their Bcl-2 expression, homeostatic-proliferation differences, and relapsing disease.

1419 Leukocyte phosphodiesterase expression after lipopolysaccharide and during sepsis and its relationship with HLA-DR expression.
Endotoxemia and sepsis are associated with different PDE mRNA expression patterns, which may be related to some aspects of septic immune dysregulation.

ON THE COVER:
Mucosal TB vaccine comprising MPL-chitosan protects mice upon challenge with clinical Mtb HN878 strain—see Ahmed et al., “Rationalized design of a mucosal vaccine protects against Mycobacterium tuberculosis challenge in mice,” page 1373.
